HARAF

Platform Overview

An Arabic-first web platform for children's speech and language learning support

About Haraf

Haraf is a web-based platform designed to support children's speech and language learning through interactive educational activities and structured practice. It brings parents and speech therapists together in one digital environment and helps families follow children's learning progress.

What the platform offers

- Interactive educational games that support listening, vocabulary, speaking and comprehension practice.
- Child profiles and parent-friendly progress tracking.
- Questionnaires that help recommend suitable educational learning paths.
- Therapist profiles, availability and online session requests.
- Administrative tools for managing users, learning content, subscriptions and payment requests.

Who uses Haraf?

Parents manage child profiles, follow recommended activities and monitor progress. Children use a friendly, engaging interface to complete learning games. Speech therapists manage their profiles and appointment requests. Administrators oversee accounts, content and platform settings.

How it works

A parent creates a child profile and completes the relevant questionnaire. The platform uses the responses to recommend an educational learning path. The child practices through interactive activities, while the parent can review results and progress. Parents can also request online sessions with available therapists.

Technology at a glance

Frontend: React.js | Backend: Node.js and Express.js | Database: MongoDB Atlas | API communication: RESTful APIs

Important note

Haraf is an educational support and practice platform. It is not a medical diagnostic tool and does not replace assessment or treatment by qualified healthcare professionals.
